

Cooling

Our cooling package is custom designed to meet your needs. The unit can be integrated into your heating system design or be made to operate on its own. The cooling unit can also be packaged with an enthalpy wheel, heat pipe, or flat plate energy recovery system to minimize the cooling loads, facilitate dehumidification, and save energy.

Utilize excess capacity in your building's chiller system by adding a chilled water or glycol section to your Quiet-Aire unit.

Electric DX cooling can be provided by creating a package with a pre-engineered condensing unit or with a fully custom designed cooling section employing energy efficient multiple stages of scroll compressors. Air cooled or water cooled condenser sections can be engineered to custom comfort, space or performance conditions.

Quiet-Aire specializes in applications for corrosive and coastal environments that require cooling as well. Specialty coil coatings and casing materials such as stainless steel are used to ensure the longevity of your custom cooling unit.

We look forward to working with you on your project needs, please contact us at:
